

I need to develop a streaming application(web application)with following specifications

1. Login page – sign in , sign up and forgot password option
2. Need to download from telegram- I mean if am downloading any content from telegram it directly needs to be saved to my streaming applications
3. This download Video I need to play without buffering
4. Need to give option for live streaming from other websites/ need to give option to upload live from other websites- I mean our web app will be act as a mediator for 2 live streaming applications, for example in YouTube or any other kind of live streaming application am logging in and I want to go to live , so normally the web page will access our camera but in our application we need connect some other livestream as camera input . So other websites live streaming I can post in my streaming account.
5. Need to host in my cPanel hosting or any cloud hosting
